Fish Karyotypes: A Check List, by Ryoichi Arai April 2011 As the largest group of extant vertebrates, fish offer an almost limitless number of striking examples of evolutionary adaptation to environmental and biotic selection pressure.

### CHROMOSOME ANALYSIS: KARYOTYPING, BANDING AND FISH

FISH (fluorescence in situ hybridization) has become a commonly used staining technique where known sequences of DNA are fluorescently labeled and hybridized to chromosomes. The process depends on complementary base pairing, similar to Southern blots. [Fluorescence in situ hybridization - Wikipedia](#) Fluorescence in situ hybridization (FISH) is a molecular cytogenetic technique that uses fluorescent probes that bind to only those parts of a nucleic acid sequence with a high degree of sequence complementarity.

### Karyotype - Wikipedia

A karyotype is the number and appearance of chromosomes in the nucleus of a eukaryotic cell. The term is also used for the complete set of chromosomes in a species or in an individual organism [1] [2] [3] and for a test that detects this complement or measures the number.
