Glissonean pedicle transection method for liver surgery

The advantage of the Glissonean pedicle approach is that it is a simple method which can separate the liver into 3 sections by simply clamping the secondary Glissonean pedicle extrahepatically without liver dissection at the hepatic hilus. The main hepatic vein, either the right hepatic vein or the middle hepatic vein, is present on the border between the sections. The relationship between the Glissonean pedicle transection method for hepatic ...

We can say that portal blood is distributed to three portions of the liver: the right segment, the middle segment, and the left segment for Takasaki; and the right posterior sector, the right anterior sector, and the left liver for Couinaud. Thus the liver is divided into three in both classifications.

The Glissonean pedicle transection method is a feasible, effective, and safe technique for hepatic inflow control during the curative resection of patients with large nodular HCCs. This method shortened the duration of ischemia and reduced the extent of liver parenchyma subjected to ischemia-reperfusion injury, compared with the conventional Pringle maneuver. The Glissonean method also reduced
