Large eddy simulation - Wikipedia

Large eddy simulation (LES) is a mathematical model for turbulence used in computational fluid dynamics. It was initially proposed in 1963 by Joseph Smagorinsky to simulate atmospheric air currents, and first explored by Deardorff (1970).

Large Eddy Simulation is a relatively new and still evolving computational strategy for predicting turbulent flows. It is now widely used in research to elucidate fundamental interactions in physics of turbulence, to predict phenomena which are closely linked to the unsteady features of turbulence and to create data bases against which

Large-eddy simulation of low frequency oscillations of the ...

Large-eddy simulations are performed to investigate turbulent flows through 90 pipe bends that feature unsteady flow separation, unstable shear layers, and an oscillation of the Dean vortices. Single bends with curvature radii of one- and three-pipe diameters are considered at the Reynolds number range 5000-27 000. The numerically computed
