Neuronal growth factors are molecules which support the survival of developing neurons, and are necessary for the maintenance of differentiated neuronal properties. In 1979-9, only one such trophic factor had been purified and shown to have a physiological role: nerve growth factor (NGF) was known to be a protein necessary for the survival of developing sympathetic neurons.

In non-neuronal cells growth factors stimulate proliferation, but mature neurons are postmitotic and cannot re-enter the cell cycle. Consequently, when considered in the context of the nervous system, growth factors are frequently referred to as neurotrophic factors. **Neuronal growth factors, neurotrophins and memory deficiency.**

Neuronal Growth Cones

What is a growth cone? Normal sensation, motor control and behavior depend on correct wiring up of neuronal circuits during fetal development. The longest components of these circuits, the neuronal axons, sprout from immature neurons and elongate precisely through diverse tissues to reach synaptic partners located throughout the developing body.

Introduction Neurons and Neuronal Growth Neurons and Neuronal Signalling. The human brain is a complex network of more than 100 billion interconnected neurons (from Greek "neuron" for "nerve"). These extraordinary cells are specialized in information processing and transmission by electrochemical signalling.

Nerve growth factor: from the early discoveries to the ...

Nerve growth factor. Nerve growth factor (NGF) is the first discovered member of the neurotrophin family . NGF is essential for the development and phenotypic maintenance of neurons in the peripheral nervous system (PNS) and for the functional integrity of cholinergic neurons in the central nervous system (CNS) (Figure 1) . The
