Each produces a mating pheromone that acts on cells of the opposite mating type. This Connection Map ( Fig. 1 ) describes the signal transduction pathway used by the yeast haploid cells to respond to the pheromone.

A pheromone is a chemical that an animal produces which changes the behavior of another animal of the same species. Some describe pheromones as behavior-altering agents.

Pheromone communication is extensively studied in invertebrates, in particular, and thousands of insect pheromones have been identified. Our understanding of pheromone communication in vertebrates, however, has progressed more slowly; for example, despite decades of research on fish, the largest group of vertebrates, only in two species, goldfish

[Evolution of a Pheromone Signaling System](#)

The Evolution of a Pheromone Signaling System: From Molecules to Mating. Tens of millions of years ago, plethodontid salamanders evolved a bizarre system of chemical communication in which courting males "vaccinate" females with a pheromone produced by a gland on the male's chin.

[Pheromone - Wikipedia](#)

A pheromone (from Ancient Greek phero "to bear" and hormone) is a secreted or excreted chemical factor that triggers a social response in members of the same species.

[Neural Mechanisms of Alarm Pheromone Signaling](#)

ALARM PHEROMONE IN ZEBRAFISH. In fish, the alarm pheromone is known as Schreckstoff ( fear substance in German), a term coined by the Austrian biologist Karl Von Frisch who described this phenomenon in 1942 [(Frisch, 1942) cited in (Stensmyr and Maderspacher, 2012)].

Main Text. Mate assessment using pheromones is known

to be widespread throughout the animal kingdom. Pheromone communication is extensively studied in invertebrates, in particular, and thousands of insect pheromones have been identified.

#### **A walk-through of the yeast mating pheromone response pathway**

The intracellular signal transduction pathway by which the yeast *Saccharomyces cerevisiae* responds to the presence of peptide mating pheromone in its surroundings is one of the best understood signaling pathways in eukaryotes, yet continues to generate new surprises and insights.

The pheromone is a polar molecule with a molecular mass between 500-1500, but no further structural characterization is available. Among the Streptophyta, sexual reproduction and pheromone chemistry has been extensively studied in the zygnemaphycean *Closterium peracerosum strigosum littorale* complex (Sekimoto
