[Protein kinase C - Wikipedia](#)

Protein kinase C. PKC enzymes in turn are activated by signals such as increases in the concentration of diacylglycerol (DAG) or calcium ions (Ca²⁺). Hence PKC enzymes play important roles in several signal transduction cascades.

[Protein Kinase C: Structure, Function, and Regulation](#)
A key regulator of protein kinase C function in vivo is likely to be subcellular distribution of both the enzyme and substrate. Protein kinase C isozymes are distributed differentially throughout the cell (and differently among many cell types), and a number of targeting proteins have been described.

Protein kinase C in the immune system: from signalling to ...

Protein kinase C (PKC) is a key family of enzymes involved in signalling pathways that specifically phosphorylates substrates at serine/threonine residues, influencing a variety of cellular events such as cell proliferation and the regulation of gene expression. PKC is a subfamily of AGC (PKA, PKG and PKC) kinases, incorporating 10 kinase members that share a highly conserved catalytic kinase

Protein kinase - Wikipedia

Protein kinase. A protein kinase is a kinase enzyme that modifies other proteins by chemically adding phosphate groups to them (phosphorylation). Phosphorylation usually results in a functional change of the target protein (substrate) by changing enzyme activity, cellular location, or association with other proteins.
