termination - Why does the CAN bus use a 120 ohm resistor ...

That type of CAN bus is intended to be implemented by a twisted pair of wires. The transmission line impedance of unspecified twisted pair isn't exact, but 120 is going to be close most of the time for the relatively large wires commonly used for CAN.

Termination Characters in NI-VISA - National Instruments

Various message-based buses use termination characters to indicate the end of a message transmission. For VISA resource types that correspond to a complete 488.2 protocol (GPIB Ins

CAN-Bus, one 60-Ohm instead of two 120-Ohm resistors

Sorry for my limited English ability and Technical ability. It is very common in our company that, the engineers don't care about (or don't know) the termination resistors on a CAN-Bus.

Solved: [LabVIEW] Send CRLF as Termination Character in ...

Yes this is correct. If you have any doubt, you can always show the string as hex. The term char is an ASCII char, so 1 byte long. However I don't see a real problem: writing, you simply add 0D 0A to the command string; reading, you can set 0A as the termination character.

CAN Physical Layer and Termination Guide - National

The termination resistors on a cable should match the nominal impedance of the cable. ISO 11898 requires a cable with a nominal impedance of 120 Ω ; therefore, you should use 120 Ω resistors for termination. If you place multiple devices along the cable, only the devices on the ends of the cable need termination resistors. Figure 1 shows an example of how to terminate a high-speed network.

1.0V to 5.5V, 1A 1ch Termination Regulators for DDR-SDRAMs

This is the output pin for the DDR memory termination voltage and it has a sink/source current capability of 1.0A. VTT VTT voltage tracks the voltage at VDDQ pin divided in half.

The newline character (\n) is equivalent to the ASCII linefeed character (hex 0A). Thus, for files opened in text mode, CR/LF pairs are read in as newline characters, and newline characters are written as CR/LF.

Termination Placement in PCB Design How Much Does it Matter?

of termination strategies in common use on PCBs, but perhaps the two most common are parallel termination and series termination. When we use parallel termination we place a terminating resistor at the end of the transmission line. The value of the resistor is equal to the characteristic impedance of the line itself, commonly referred to as Z_0 . A closely related strategy is a Thevenin
